

CLINICAL ORDER FLOWCHART

VN-BECS V2.0 SYSTEM INTEGRATION

DOCUMENT: ORDER REQUISITION
STATUS: **APPROVED**
REF: SOP 07 / SOP 10 / AABB

STEP	SUBSYSTEM / FEATURE	WORKFLOW & REQUISITION LOGIC
01	Transfusion Service (Hospital)	CLINICAL ORDERING & EMERGENCY REQUISITION Physicians place ordering requisitions for specific patients in the system. Clinicians can request standard crossmatching or trigger a 1-click STAT 'Massive Transfusion Protocol' (MTP) for trauma emergencies.
02	Immunohematology & Reference Lab (IRL)	ORDER INTEROPERABILITY & QUEUE ALARM The clinical request instantly pushes to the IRL Control Tower. Standard requests enter 'Pending Crossmatch' (待處理交叉匹配). Emergency MTP orders trigger flash-red alarms in 'Urgent Clinical Requests' (緊急臨床血袋申請) for

STEP	SUBSYSTEM / FEATURE	WORKFLOW & REQUISITION LOGIC
		prioritized processing.
03	IRL Compatibility Testing Node	COMPATIBILITY TESTING & MATCH VERIFICATION The medical technologist fetches the patient's MRN and antibody history. The system enforces strict matching protocols: Electronic Crossmatch (EXM) for antibody-free patients, and Serological IS/AHG for patients with positive antibody history.
04	Blood Supply Hub (Hub)	COLD CHAIN DISPATCH & FEFO PICK Once compatible units are verified, the Blood Supply Hub acts on the release command. Utilizes FEFO (First-Expire, First-Out) algorithms to auto-select and dispatch the optimal blood units under continuous IoT cold chain tracking.
